Quality of Life: A Buzz Word?

- ❖ **QoL:** “Individuals’ perception of their position in life in the context of the culture and value systems in which they live and in relation to their goals, expectations, standards & concerns” (WHO).
- ❖ **HRQoL** (Health related quality of life) confines the domain to the repercussions of disease and its treatment
- ❖ **HRQoL** is a broad, multidimensional and subjective construct that synthesizes a number of dimensions commonly described as patient-reported outcomes (**PROs**)
- ❖ 2 types of scales: generic and disease-specific scales
- ❖ Many scales available in Chronic Veinous Disease (CVD). Which one should we recommend?
- ❖ Until now, no comprehensive systematic review has compared the psychometric properties of the available CVD-specific scales

Objectives

- To study how the specific CVD-specific QoL scales were both psychometrically and linguistically validated
- To document the indications in which these scales have been used and the design of the corresponding studies that were implemented
- To identify the respective advantages and gaps in the scales used for CVD

METHODS

Robert Launois

REES

Electronic Searches

Systematic review

The review question is structured around the 5 components of the of PICOS acronym Patient ,Intervention, Comparator,outcome, study design

1. Literature search
 - At least two databases required
2. Eligibility and exclusion criteria
 - to minimize bias
3. Studies selection
 - 2 Independent reviewers
4. Critical appraisal following the full text selection stage
 - Quality assessment; poor quality studies were excluded

Data Extraction

6. Summary of Findings (SOF) + Plain Language Summary (PLS)

Meta-analysis *(deemed inappropriate in this case due to large heterogeneity – 11 different scales)*

Summary of Findings

Original Article	Author	Country	Year
	Lamping, D.L., et al.	France, Belgium, Italy, Canada	2003
Title	Evaluation of outcomes in chronic venous disorders of the leg: Development of a scientifically rigorous, patient-reported measure of symptoms and quality of life		
Journal	Journal of Vascular Surgery.2003 37(2): 410-419		
Objective of the study	To develop a practical and scientifically rigorous patient-reported outcome measure to evaluate QoL and symptoms in chronic venous disorders of the leg		
Qol instrument and version	VEINES-QOL/Sym		
Language versions	French, Italian, French Canadian		
CEAP range covered	C0-C6		
Target population	Patients with chronic venous disorders of the leg		
Inclusion criteria	18-75 years of age, written informed consent		
Exclusion criteria	Not having given written informed consent, age <18 or >75 years		
Follow up period	12 months		
Method of administering	Auto questionnaire		
Length of questionnaire	36 items		
Time required to fill questionnaire	≈ 10 minutes		
Conditions for validation Checked	Reliability	Construct validity	Responsiveness
	Yes	Yes	Yes
Number of items modified	Added	Removed	Updated
	N.A.	N.A.	N.A.
Number of patients	615		
Mean[SD] age of the subjects	54 (CI 95% : 20-75)*		
Acceptability	Good acceptability for all four language versions, low proportion of missing data (<5%)		
Results from the study	The VEINES-QOL/sym was reported to be a practical and scientifically sound instrument to measure outcomes in chronic venous disorders of the leg		

Psychometric Properties

Reliability (*Precision*):

- ❖ Do answers to the same questions remain unchanged over time in clinically stable patients?
- ❖ Measured by the Cronbach's alpha, values ≥ 0.70 acceptable

Construct Validity (*Accuracy*):

- ❖ Dimensions stability : Are the factors cover the same set of questions across various populations?
- ❖ Within-scale analysis: Are individual items more highly correlated with their own dimension compared to others dimensions?
- ❖ Mean known group differences: Are QOL scores significantly different across groups known to be different (ie. different disease severity) at a given point of time?
- ❖ Convergent validity: Do QOL correlations with clinical criteria and/or other validated quality of life scales fit expected results?

Responsiveness (*Sensitivity*):

- ❖ Do QOL scores change over time, beyond the noise caused by measurement error, in clinically unstable patients?
- ❖ Measured by the effect size, values ≥ 0.70 are acceptable

DISCUSSION

Robert Launois

REES
FRANCE

Limitations

Our findings must be interpreted in light of the following limitations.

- First, a number of records could not be reviewed given that many of those were written in foreign languages and others could presumably be part of the grey literature
- Second, due to the nonuniform nature of the validation results and the general lack of consensus on definitions, it is not possible to conduct a meta-analysis
- Third, we used a smaller time frame compared with the standard time frame used in systematic reviews.

Conclusion

- Our study revealed 11 CVD-specific scales that are currently used as a means to assess and measure health-related quality of life among CVD patients
- The CIVIQ, AVVQ and VEINES-QOL/SYM scales were the most frequently used and validated in the literature. The choice of scale depends on the general objective of the study
- Furthermore, we confirmed both the effect of CVD on health-related quality of life, and the factorial structure of the CIVIQ-14 questionnaire
